Quiz-Tac-Toe

A sample dossier for IB Computer Science, Standard Level

Written by Dave Mulkey, Germany, July 2008

Comments

The intention of this sample dossier is not to present a "perfect" product, but to provide a basic model, showing some good ideas and techniques that students could use to achieve a good mark on their Internal Assessment. I have not marked this dossier (I find it difficult to mark my own work objectively), but I'm pretty sure this work would receive a grade 6 or 7. As far as I know, there is nothing "missing" in this sample, and I will encourage my students to use this as a guide to ensure that their work is complete. The dossier took 40-50 hours to complete (didn't time it exactly). Despite my best efforts, it didn't quite fit into 100 pages.

The author is an IB Computer Science teacher at Frankfurt International School. I have been teaching IB Comp Sci for over 20 years, as well as moderating IB Dossiers for about half that time. The techniques shown here are similar to many good dossiers that I have moderated in the past, as well as dossiers that my students have submitted. I believe it follows the requirements and intentions of the IA Criteria. The only "non-standard" part is the use of "user-stories" as the primary vehicle for systems analysis. This is a concept borrowed from Extreme Programming. I find this an easy methodology for my students to understand. Certainly UML, questionnaires and other techniques are equally valid.

For further guidance, I recommend studying the graded examples in the Teacher Support Materials, as well as carefully reading and following the Assessment Criteria in the Subject Guide.

Teachers are welcome to distribute this work to their students and to use it for educational purposes, but I reserve the copyright and any commercial uses are prohibited. I make no claims are guarantees that students who follow this example will necessarily receive good grades.

Students are discouraged from copying any of the Java code in the program listing, and are reminded that any copied code from any source must be properly attributed and may not be used to satisfy mastery factors.

My students have considerable success writing GUI applications using EasyApp. Anyone interested in using EasyApp to build a GUI application can download a copy at: <u>http://ibcomp.fis.edu/Java/EasyApp.html</u>

I welcome questions and suggestions, especially if you find mistakes (likely). Please address questions and comments to: Dave_Mulkey@fis.edu

Mastery Factors (final)	90

Criterion A1 – Analyzing the Problem

Describing the Problem

Our school has lots of computers, as well as a SmartBoard in every classroom. The teachers keep trying to find clever ways to use the computers to improve classroom instruction. They look for "educational software", like games and quizzes and videos and web-sites.

Ms Fizz is a math teacher at our school. She asked our Computer Science teacher whether the IB Computer Science students could create software for her to use on her SmartBoard. So I went to talk to Ms Fizz about some ideas. She said she wasn't interested in videos or that sort of thing, and that most web-sites were pretty useless. But her students need lots of drill and practice, and maybe she would be interested in programs that let the students do more drill and practice at home. She had seen lots of educational software, but mostly it was either for social studies – like multiple choice quizzes – or it was for **doing** math, like drawing graphs. She wanted a math **quiz** program that the students could use on their own, or maybe she could run it on the SmartBoard during class.

After a bit of discussion, and some web-surfing, Ms Fizz mentioned an old TV show called "Hollywood Squares" that was sort of a combination of Tic-Tac-Toe and Trivial Pursuit. She described it like this:

There is a Tic-Tac-Toe board. When the X-player chooses a square, they have to answer a question correctly in order to get their X on that square. Then it's O's turn. If the player answers incorrectly, they don't get the square. So you could end up with a board looking like this if O missed a question and X answered correctly 3 times:

	0	
Χ	Х	X

Ms Fizz had the idea that the questions could be math problems. Then 2 students could play against each other, or she could split the class into teams that play against each other using the SmartBoard.

User Stories

These user stories summarize some of the discussion, especially where it leads to ideas for input, processing, and output.

Quiz-Tac-Toe

<i>Homework is Boring and Ineffective</i> My students say homework is boring, so I'd like a game that is fast and fun and will motivate my students to practice. It needs to have quick and easy questions, and let the students answer them quickly and with minimal effort.	<i>Clever Students Should be Rewarded</i> Often the homework assignments are too easy for the more capable students. They finish quickly and get all correct answers. I'd like them to have a reason to do more problems. Also the challenge of playing against another student should provide extra motivation.
Input: problems and student answersProcessing: check whether student's answer matches the correct answerOutput : an X or O in the Tic-Tac-Toe board	Input : problems and answers from 2 students Processing: the game determines a winner Output : game board and notification of winner
Students Should Choose their Topic	Students Need a Clear Challenge
Students should be able to choose more practice on topics that they haven't mastered - especially when preparing for a test. So there needs to be a way that the students can choose the topic.	Using a known game, like Tic-Tac-Toe, provides a clear goal and an appropriate challenge. Students can measure their own achievement.
	Input : students choose their topic and answer
Input : name of topic	questions
Processing : game loads a set of questions from	Processing : computer correctly enforces the
the chosen topic area	standard Tic-Tac-Toe rules and decides whether
Output : game presents questions from chosen topic area and tells whether answers are correct	answers were correct and who won Output : game board, responding to answers, checking who wins
	-
<i>Various Types of Problems</i> I give small 10 minute quizzes about twice a week. I'd like to use the same type of questions as I have on these quizzes. Those are short problems with either multiple choice answers,	<i>Typing Special Symbols</i> Math problems often contain special symbols like square-root signs, squared and cubed exponents, and fractions. I'd like to be able to type the questions in with a normal keyboard,

type the questions in with a normal keyboard, but the problems should appear with the correct math symbols

Input : copy existing quiz problems into the computer to be used in the game	Input : typing on a normal keyboard, using short-cuts for special symbols
	Processing : translate shortcut abbreviations to correct math symbols
Output : problems are saved in data files on the hard-disk	5

or quite simple numerical answers, or single

word answers (like fill-in-the-blank).

Collecting Information and Sample Data

Since the game is for a math class, the questions need to be math problems (or questions about math vocabulary). We looked at some multiple-choice quizzes, some written tests, and some of the homework problems in a math text-book. Here are some sample questions:

Quiz	Text	Homework
(1) If the discriminant of a	(1) Draw the graph of	(1) Graph each parabola:
parabola is -4, how many roots	$y = \frac{x^2 - 4x + 3}{x - 3}$	(a) $y = x^2 - 4x + 3$
does it have?	$y = \frac{1}{x-3}$	(b) $y = x^2 - 4x + 4$
(a) 0 (b) 1 (c) 2 (d) 3		(c) $y = x^2 - 4x + 5$
	(2) Find the intersection of	
(2) What is the sum of the roots	$y = 2x + 3$ and $y = x^2 - 4$.	(2) For each graph in $\#1$,
of $x^2 - 4x + 2 = 0$?	Show your work.	state the number of roots.
(a) 2 (b) 4 (c) 0 (d) 1		
	(3) Explain how the	(3) Write the formula of a
(3) Where is the vertex of the	discriminant is used.	parabola through $(-1,4)$, $(0,1)$
parabola $y = x^2 - 4x + 2$?		and (1,0).

Ms Fizz was especially interested that the game be "fast" and "easy" and "fun". She felt that her students would be more likely to use the game if the questions were quick and easy to answer, if typing the answers was easy, and if the game ended quickly so the students could play again.

It was apparent that not all the sample questions would be suitable for use in a computerized quiz game. For example, asking the players to draw a graph is probably out of the question.

- The questions should be short and have quick answers
- The students cannot be required to draw graphs or other pictures
- The answers should not require the students to write complex formulas
- Some special symbols, like powers, should be used in the problems, as computer symbols like x² are not understandable to many students
- "Show your work" is not sensible

Looking at the sample questions, it seems the quiz questions were most suitable. Multiple-choice is particularly good, but simple numerical answers would also be acceptable.

Systematic Analysis of Input, Output and Processing, Possible Difficulties and Advantages

The appearance of the Tic-Tac-Toe board is pretty obvious, but the input and output of math formulas and symbols might cause some difficulties. And creating problems might be tricky.

Outputting Questions	Inputting Answers	Processing
Math formulas often contain	This has the same problems as	The questions need to come

graphics mode.	good enough.	as the user might type 0.3333 instead of 1/3.
		insteau of 1/3.

Ms Fizz agreed to produce a list of sample problems to discuss. I warned her that some problems might not be suitable, as the printing and typing might be too difficult.

After some discussion, we agreed that multiple-choice questions were a good strategy, because they are quicker to answer and require very little typing. But I couldn't imagine how to program the computer to randomly generate 3 incorrect answers along with the right answer. So we agreed that the teacher would need to write the questions ahead of time rather than the computer "generating" the problems. True/false questions are possible, as well as simple numbers like whole numbers.

Possible Advantages of a Computer System

Since some math formulas and problems might be excluded from the game, it's important to consider the advantages of using a computerized game.

- Students can practice as much as they wish, without needing the teacher around
- The computer gives immediate feedback about whether answers are correct
- Working with another student and playing a game should be fun and motivating, and encourage students to spend more time practicing than they would otherwise
- The teacher can use the game on the SmartBoard during class as a motivational tool

Criterion A2 (preliminary) – Criteria for Success

Considering the analysis, the following goals seem sensible. The reasons in the chart were mentioned in the analysis above.

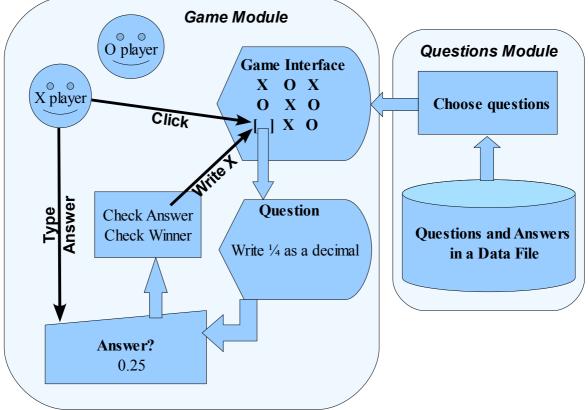

Goal	Reason(s)	Limitation(s)
Game plays Tic-Tac-Toe, using correct Tic-Tac-Toe rules	It's fun	3x3 board only
Each Tic-Tac-Toe square asks a question	That's the rules of the game	Questions will be selected from a list – not auto-generated
Questions should contain appropriate math content	Students should be learning and practicing their math	Some text-book problems are not suitable – e.g. complex formulas or graphs
Game should be quick, easy and satisfying, including a simple and clear user-interface	Motivate students to practice , more fun = more practice	Don't require complex input (fractions, complex formulas)
Teacher can create and save problems	Auto-generating problems is too difficult to program	No complex formulas Pictures?
Some special symbols can be used in the questions – squares, cubes, simple square-roots	Math without special symbols is difficult to read and understand	Many special symbols will not be implemented, especially fractions and complex surds like the discriminant in the quadratic formula

These were the preliminary goals, used to create the initial design and prototype. After discussing the prototype with the user, the goals were revised. The complete goals are presented below, following the prototype.

Criterion A3 – Prototype Solution

Initial Design

The initial design includes a data-file containing questions and the game module for playing the game.

The finished program will need a large set of questions, but the prototype will have hard-coded questions for test purposes. So the Questions Module will not appear in the prototype - it is only simulated.

Prototype

We sketched out some ideas on paper, but Ms Fizz really wanted to see "how it's gonna look." We decided a functional prototype - as a short Java program - would be best. So I wrote a short Java program that let Ms Fizz click on the Tic-Tac-Toe board, answer questions, and win the game. Although it had the same 9 questions all the time, it convinced her that the students would be able to use the game easily.

The following pages show some sample screen-shots of the running prototype. We ran the prototype more often than shown in the screen-shots - enough to convince Ms Fizz that it would be worthwhile to proceed with the project.

After trying out the prototype, Ms Fizz had suggestions for improvement. Her ideas are presented at the end of the screen-shots.

Prototype – Sample Screens ** the code listing is at the end of Stage A **

The quiz starts, X plays first.

4			
		₽laye X	r

X clicks on the top-left corner and answers the question.

٠			
	<u></u>	Player Player Player Mage Player Mage Player Player Player Mage Player P	

٢				
	X		Player	

X had the correct answer, so gets the square. Now it is O's turn.

O chooses the middle square and answers the question.

4						
	Х				Player	
		La I	Input		Ο	X
			?	What nationa German	ality was Karl Friedrich Gaus Cancel	ss?

O answers correctly and gets the square.

\$				
Х		ß	Player	
	Ο		X	

X tries for the top-right corner, but answers the question incorrectly.

4			
	Х	Player	
		Who is a famous mathematician Eunice, Euclid, or Euyou? Eunice OK	

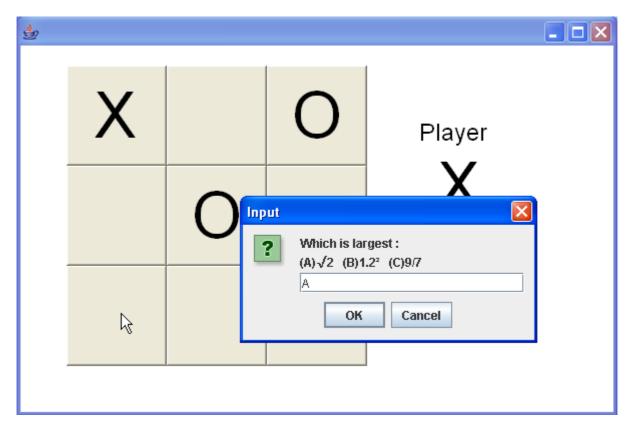

X answered incorrectly and thus didn't get the square. Now it's O's turn.

<u>ی</u>					
	Х		ß	Player	
		Ο		Ο	
				1	

O tries the top-right square again, because the question was easy.

4					
	Χ	\cap	k Input	Player	X
			? Who	is a famous mathematician ce, Euclid, or Euyou? id OK Cancel	

O answered correctly and got the square. Now it's X's turn. X goes for the block in the bottom left.

X had the right answer and gets the square. Now O goes for the block in the middle-left.

4					
	Х		Ο	Player	
	Ŀ,	O	put	O 🛛)
	Х		P How many 8 OK	faces does a cube have?	
				1	

O answered incorrectly. Now X goes for the win.

-					×
	Х		Ο	Player	
	Ŀş	0	Input	X	
	Х			ny faces does a cube have? OK Cancel	

X answered correctly and wins the game!

٠					
	Х		Ο	Player	
	Х	O	essage	X	
	Х	(i X wins!	ок	

User Feedback about the Prototype

We ran the prototype several times. Ms Fizz wanted to check whether the prototype worked for wins along the diagonals – it worked okay. Ms Fizz had many questions – below is an excerpt. The discussion was longer (several sessions actually), but these outline the issues affecting goals.

User Questions, Ideas and Wishes	Answers
Does it correctly recognize wins in all directions (including diagonals)?	Yes (we tested all the directions)
What happens if there is a tie – the board is full but no winner?	The prototype doesn't recognize a tie, but the final program will stop and say "It's a tie". Is that okay?
If there is a tie, I guess the player with more squares should win.	Okay, we can do that.
This always has the same 9 questions. I think it should have different questions (selected randomly) each time you run it.	Okay, we can do that in the final program. Do you want the computer to invent the questions?
Can the computer invent the questions?	Not really, unless they are simple math calculations.
No, I want more flexibility in the questions. Some have words or formulas as answers, others are numbers.	Okay, then we need to make a module that lets you type in questions, then save them in a file, and the program loads the questions from the file.
I don't understand about saving in files. Is that hard?	No, we'll make a real simple interface and the saving and choosing random questions is all automatic.
But I want the questions scrambled up, so the players don't always know which question is hiding in each square.	If the questions are selected randomly, they'll also be arranged randomly in the squares.
I think in the old Hollywood Squares show, a wrong answer automatically gave the square to the other player. Is that possible?	Yes, it's possible – is that what you want?
I don't know – I'll think about it. Can I type real math formulas, with exponents and fractions?	No, I don't know how to program that. I guess you can type x-squared if you know the ASCII code for the squared sign, but no fractions.
Okay, I guess I can just type 3/4, like that. How about pictures – can I put in pictures?	I'll think about that. I don't know how to do it, but I'll ask my teacher if it's possible.
How many questions can I have altogether?	There is no limit. But it would be easier to write the program if we set some kind of limit – like 1000 questions maximum. Is that okay?
Is that a 1000 for EVERYTHING? I have lots of different classes, different each year.	We can make separate files for different subjects. What subjects do you need?
Let's see simple algebra, advanced algebra, geometry, statistics, a few more. Maybe a 100 for each. How many can I have?	If you make a list of subjects and/or topics, we can make a set of questions for each. You can have any limit you like, but it's easier if the limit is fixed.
Okay, I'll think about it and make a list.	Can you make a list of topics and 10 sample questions for each? You can add more later.
Will this run on the school's web-site?	No, but it can run from a server on our LAN.

Revised Criteria for Success after User Feedback

As a result of the user feedback, the original goals (Criteria for Success) were revised. Changes and additions are marked with ** asterisks.

Criterion A2 (Final) – Criteria for Success

Goal	Reason(s)	Limitation(s)
Game plays Tic-Tac-Toe, using correct Tic-Tac-Toe rules	It's fun	3x3 board only
Each Tic-Tac-Toe square asks a question	That's the rules of the game	Questions will be selected from a list – not auto-generated
** Questions will be selected randomly and scrambled	Students should not know which questions are hiding in each box	
Questions should contain appropriate math content	Students should be learning and practicing their math	Some text-book problems are not suitable – e.g. complex formulas or graphs
Game should be quick, easy and satisfying, including a simple and clear user-interface	Motivate students to practice , more fun = more practice	Don't require complex input (fractions, complex formulas)
Teacher can create and save problems	Auto-generating problems is too difficult to program	No complex formulas Pictures?
Some special symbols can be used in the questions – squares, cubes, simple square-roots	Math without special symbols is difficult to read and understand	Many special symbols will not be implemented, especially fractions and complex surds like the discriminant in the quadratic formula
** Teacher module for typing and saving questions and answers	Teacher wants to create specific questions	Only a few special symbols Text only - no pictures
** Questions are saved into various files according to topic. Teacher should be able to add more topics (files) later	Teacher has various classes and topics	There will be a limit of 1000 questions per file
** Questions in data-files can be added, changed and deleted later	Teacher may need to make changes and corrections	This will not be drag-and-drop, but will function in text-mode after a simple search
** It should be easy to copy a problem, change a few numbers and then save as a new problem	Teacher wants to make several similar questions with slightly different numbers	It will be done in text-mode, not drag and drop

Prototype Listing (Functional Prototype)

```
import java.awt.*;
public class ProtoSquares extends EasyApp {

    { output(d + " wins!");
      System.exit(0);
    }
}
```

Stage B1 - Data-Structures

The program will contain 3 sections (modules) :

Students' Game Interface , Problem Storage , Teachers' Problem Interface

Problem Storage in Files

All the problems must be stored in **data-files** on a disk drive. The teacher wants separate problem lists for various topics. Each file must contain a record for each problem. Each record contains three fields : Question, Choices and Answer. If the question is longer, the Choices can contain part of the question instead of multiple answers, but then the user must type the exact answer.

A multiple-choice problem looks like this:

Question : What do you call a polygon with 8 sides? Choices : (A) Eightogon (B) Stop Sign (C) Octagon (D) Octogon Answer : C

A type-the-exact-answer question looks like this:

Question : What is the sum of the roots of this quadratic equation? Choices : $x^2 - 4x + 2 = 0$ Answer : 4

Text-files have the advantage that it is possible to make small corrections using a text-editor. However, they allow only sequential access. Since a small set of 9 questions must be selected at random from the file, a RandomAcessFile is more efficient as single problems can be accessed directly by their record number. Although RandomAccessFiles are a bit trickier than sequential files, the coding will probably be shorter in the long run with RandomAccessFiles.

The files will each contain 1000 records (fixed file size). Blank records will contain zero-length Strings (blank). Each record will be 200 bytes, so 200 KiloBytes per file.

Ms Fizz agreed to these shortcuts: ^2 for squared, ^3 for cubed, and ^r for a square-root sign $\sqrt{}$. Like this: Roots of $x^2 - 6 = 0$ are $\sqrt{r6}$, $-\sqrt{r6} \implies$ Roots of $x^2 - 6 = 0$ are $\sqrt{6}$, $-\sqrt{(6)}$

Each data-file will look something like this file for Algebra2:

Record #	Fields and Sizes	Sample Data
0	Question: 90 bytes Choices : 90 bytes Answer : 20 bytes	Which is a root of $2x^2 - 6 = 0$? (A) ^r2 (B) ^r3 (C) ^r6 (D) ^r12 B
1	Question: 90 bytes Choices : 90 bytes Answer : 20 bytes	Where is the vertex of this parabola? $y = x^2 + 4x + 4$ (-2,0)
999	Question: 90 bytes Choices : 90 bytes Answer : 20 bytes	(C7) (C7) (C7)

Ms Fizz has asked for the following topic files:

- Numbers (fractions, decimals, percents)
- Shapes (Circles, Rectangles, Triangles, etc)
- Statistics
- Equations (solving linear equations)
- Quadratics
- Graphs
- ... more to be added later ...

We agreed there should also be a feature to create a new topic. That will create an empty file with 1000 records. That way she can add more topic files whenever she wants. Here are 2 sample files showing 5 questions each:

Numbers	Quadratics
Which decimal equals 3/8? (A) 0.38 (B) 0.375 (C) 0.388 B	Which is a root of $2x^2 - 6 = 0$? (A) ^r2 (B) ^r3 (C) ^r6 (D) ^r12 B
Which fraction is largest? (A) 3/4 (B) 4/5 (C) 7/8 C	Where is the vertex of this parabola? $y = x^2 + 4x + 4$ (-2,0)
What is 2/3 + 1/12 ? (A) 3/4 (B) 3/15 (C) 9/12 A	Fill in the blank to "complete the square" $x^2 - 6x + $ 9
Which number is the largest? (A) Billion (B) Million (C) Googol C	Solve: $2x^2 - 8x + 6 = 0$ (A) 1, 3 (B) -1, -3 (C) 2, 6 A
Calculate 30% of 30. 9	True or false: The Vertex of $x^2 - 15$ is located directly on the x-axis. True

Teacher Interface - Problems Stored in a Problem Class

The teacher must add new problems to the problem files. The program needs to control the input to prevent the teacher typing text that's too long for the 90 byte fields in the file. It must also convert shortcut codes to proper ASCII characters. The simplest way to do this is to create a data-storage Class called Problem. This class can store the 3 fields for a single problem (Question, Choices, Answer) and also ensure that these fields contain valid data by using **accessor** methods (**get** and **set** methods). The class will look something like this:

```
public class Problem
{
  private String question = "";
  private String choices = "";
                           = "";
   private String answer
   public boolean setQuestion(String q)
   {
      // replace shortcuts ^r , ^2 , ^3 with ASCII characters
      // check that q.length is under 88 bytes
      // if not, return false as a rejection message
      question = q_i
      return true;
   }
   public boolean setChoices(String c)
   {
      // similar to setQuestion
   }
   public boolean setAnswer(String a)
   {
      // similar to setQuestion, but length must be under 18
   }
   public String getProblem() { return problem; }
   public String getChoices() { return choices; }
   public String getAnswer() { return answer; }
   public boolean saveProblem(String fileName, int record)
   { // saves this problem into fileName
     // in position specified by record
     // writes question, choices, and answer into the file
     // returns false if the operation failed
   }
   public boolean loadProblem(String fileName, int record)
   { // loads the problem from fileName
     // at position specified by record
     // reads question, choices, and answer into the file
     // returns false if the operation failed
   }
}
```

Game Interface - Arrays of Problems and Buttons

Set of 9 Problems in 1-D Array

The Game Interface module can use the same **Problem** class for storing problems. Each game must select 9 random problems from the Files discussed above. So it will use those same files. After selecting 9 random problems, the problems can be stored in an array - an array of Problem objects:

Problem[] problems = new Problem[9] ; // 1-dimensional array

The data will be the same as the data stored in the files (see above for sample data).

This array must be scrambled up randomly before starting the game - this can be done by swapping two random locations and repeating that hundreds of times. It's like shuffling cards.

GUI Buttons in a 1-D Array

Although the Tic-Tac-Toe board is in the shape of a 2-dimensional array, the coding for this is unnecessarily long. It's simpler to make a 1-dimensional array of Buttons.

Button[] squares = new Button[9] ; // 1-dimensional array

square[0]	square[1]	square[2]
at 50,50	at 150,50	at 250,50
» problem[0]	» problem[1]	» problem[2]
square[3]	square[4]	square[5]
at 50,150	at 150,150	at 250,150
» problem[3]	» problem[4]	» problem[5]
square[6]	square[7]	square[8]
at 50,250	at 150,250	at 250,250
» problem[6]	» problem[7]	» problem[9]

This approach is different than the prototype. It requires a bit of care in calculating the coordinates for the positions of the buttons - coordinates are shown in the diagram above.

The checkWinner() method is also a bit different than the prototype - it's actually shorter and easier to code, but requires a bit more thought than a 2-D array. Checking the columns for a winner will look something like this (it's actually less code than the prototype):

```
for (int col = 0; row < 3; row = row + 1)
{ String a = squares[col].getLabel();
  String b = squares[col+3].getLabel();
  String c = squares[col+6].getLabel();
  if (!a.equals("") && a.equals(b) && b.equals(c))
    { output("Player " + a + " wins" ); }
}</pre>
```

This also turns the **problems[]** and **squares[]** arrays into **parallel arrays**, making lots of the coding simpler. For example, if **squares[3]** is clicked, then **problems[3]** is displayed.

Stage B3 - Modular Organization

Tasks Outline

I started organizing the solution by outlining the **tasks** that the users will perform and the **processes** that the program will perform automatically. This **outline** breaks down the **tasks** and connects them to the \sim automated processes \sim that must run in response. This is an overview - details are missing.

~ relevant automated computer processes

TEACHER

> Choose a topic

~ store topic name and open data file

 \sim create and display an empty Tic-Tac-Toe board

> Add a new problem

- ~ format problem and replace keyboard shortcuts
- ~ save problem in data file

> Search for problem

- ~ input text
- \sim search for problems containing matching text
- ~ display each matching problem, until user accepts problem or says to quit

> Edit a problem

- \sim load the old version of the problem
- ~ allow user to make changes
- ~ format problem and replace keyboard shortcuts
- \sim save problem in data file back at the same record number

> Delete Problem

- \sim search for the problem, either by text or record number
- \sim ask user whether it's the correct problem
- \sim if okay, then erase the problem by writing blanks into the file

> View Entire File

- \sim input all problems from the file
- ~ display all problems in a scrolling text-area

STUDENTS

> Choose a topic

~ store topic name and open data file

 \sim create and display an empty Tic-Tac-Toe board

> Click on a square

 \sim check that square is still empty

~ if okay, then

display the question and input the student's answer

check the answer and mark square if correct

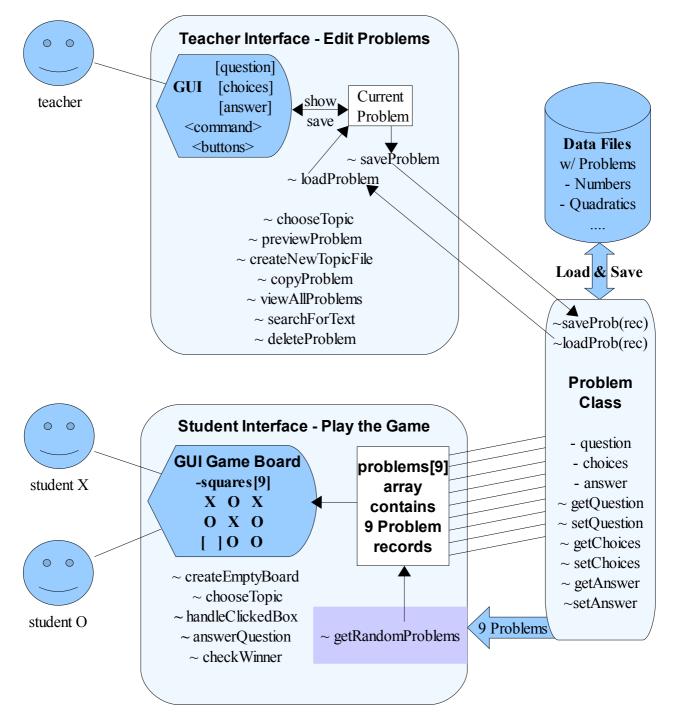

check if there is a winner, then change to other player's turn

Modular Organization Chart

This chart outlines the main modules for the Quiz-Tac-Toe system. This concentrates on the **computer program's** structure - it does not attempt to present the user tasks or actions. The main purpose is to organize the **computer processes** from the outline (above) into modules. The processes have been identified as **methods** and organized into modules (classes).

All access to Data Files should happen through the Problem Class, to ensure proper formatting and to avoid recoding duplicate file access methods in the teacher and student modules

The ~ symbol denotes methods. The arrows show data flow (problems) between various modules.

Stage B2 - Algorithms

Now that the methods have been named and organized, this section presents the methods as **algorithms** with detailed **pseudocode**, **parameters**, **return values**, **and pre- and post-conditions**. Simple methods are not shown in detail - only the non-obvious and non-standard algorithms are presented in detail. Pre- and post-conditions are only shown where they are significant.

```
== Problem Class ==
```

```
private String question
   private String choices
   private String answer
** get and set accessor methods **
   getQuestion() returns String
         return question
   ... getChoices and getAnswer are similar ....
   setQuestion(String q) returns boolean
         // q contains text
            either false is returned
         11
         11
                 or true is returned and question = q
         replace shortcuts ^r , ^2 , ^3 with ASCII characters
         if q.length > 88 then
             return false
         else
             question = q
              return true
   .... similarly for setChoices and setAnswer ....
** data file access methods **
   saveProblem(String fileName, int record) returns boolean
         // fileName contains a valid name
         // return false if method fails
         11
              else question, choices and answer
         11
              have been saved in filename at #record
        try
         { open(fileName)
            file.seek(200*record)
            write question
            file.seek(200*record + 90)
            write choices
            file.seek(200*record + 180)
            write answer
            close file
            return true
         }
         catch (Exception)
         { return false }
   . . . . . . . . . . . . . .
```

```
loadProblem(String fileName, int record) returns boolean
     // fileName must be a valid name and the
          return false if method fails or if
     11
     11
               #record contains blank Strings
     // else question, choices and answer
            contain values from the data file
     11
     try
     { file = open(fileName) for reading only
        file.seek(200*record)
        read question
        file.seek(200*record + 90)
        read choices
        file.seek(200*record + 180)
        read answer
        close file
        return true
     }
     catch (Exception)
     { return false }
. . . . . . . . . . . . . .
```

     put blanks into current problem
     saveProblem(topic, rec)
. . . . . . . . .
```

Preliminary Mastery Check

Judging from the Stage B Detailed Design, the following SL mastery factors should be satisfied:

Arrays	Button[] squares, Problem[] problems in Game class
User-defined objects	Problem class
Objects as data records	Problem class
Simple ifthen	many places
Complex ifthen	check method in Game class
Loops	many places
Nested Loops	getRandomProblems in Game class
User-defined methods	many
User-defined methods with parameters	many
User-defined methods with return values	many
Sorting	
Searching	searchForText and deleteProblem
File i/o	RandomAccessFiles in Problem class
Additional libraries	AWT GUI interfaces in Game and Teacher modules
Sentinels or flags	boolean return values for many methods

It appears that 14/15 mastery items will be demonstrated, so this should be sufficiently challenging.

C2 - Handling Errors

File Access

All file-access commands are wrapped in **try..catch..** blocks, in order to trap all IOExceptions. See **saveProblem** and **loadProblem** in the Problem.java class.

Cheating In the Game

If a user clicks on a box that is not empty, it is rejected *(screen G17)*. See Game.java, lines 63-82.

Inputing an Incorrect Topic Name

If the students type a topic name that does not exist, it is rejected *(screen T9)*. See Game.java, lines 111-120.

If the teacher types a topic name that does not exist, it is rejected *(screen T1)*. See ProblemEditor.java, lines 55-65.

Saving Problems

If the teacher forgets to type an answer to a problem, she is warned *(screen T5)*. See ProblemEditor.java, lines 155-158.

Deleting Incorrectly

If the teacher clicks the [Delete] button before choosing a problem, an error message is displayed *(screen T7)*. See ProblemEditor.java, lines 261-272

Answers are Not Case Sensitive

Players can type capital or small letters, as they wish. See Game.java, line 65.

Returning Boolean Flags

Many methods return a "success" flag as a boolean value. (<u>*T1-T12*</u>). For example, the saveProblem and loadProblem methods in the Problem.java class.

C3 - Success of the Program - Testing Criteria for Success

The following table shows the Criteria For Success from A2, together with references to screenshots showing that the Criteria were achieved.

Criteria for Success	Success?
Game plays Tic-Tac-Toe, using correct Tic-Tac- Toe rules	Yes - (T15) to (T22)
Each Tic-Tac-Toe square asks a question	Yes - various screen-shots
Questions will be selected randomly and scrambled	Yes - see various games in (G) screen-shots, especially (G2) and (G11)
Questions should contain appropriate math content	Yes - various screen-shots
Game should be quick, easy and satisfying, including a simple and clear user-interface	Yes - various screen-shots
Teacher can create and save problems	Yes - all the (E) screen-shots
Some special symbols can be used in the questions – squares, cubes, simple square-roots	Yes - (E11)
Teacher module for typing and saving questions and answers	Yes - all the (E) screen-shots
Questions are saved into various files according to topic.	Yes - various screen-shots, especially (T5) and (T6)
Teacher should be able to add more topics (files) later	Yes - (E12) to (E14)
Questions in data-files can be added, changed and deleted later	Yes - various (E) screen-shots
It should be easy to copy a problem, change a few numbers and then save as a new problem	Yes - (E17) to (E20)

Stage D1 - Annotated Hard Copy of Test Output

The test output is organized into 4 sections

- 1. Typical run of the Teacher's Problem Editor
- 2. Typical run of the Students' Game
- 3. Testing reliability and error-handling
- 4. Testing Criteria for Success

Editor - Typical Run for Teacher's Problem Editor

(E1) The teacher opens an existing file - quadratics.

Quiz-Tac-Toe - Instructions

Quiz-Tac-Toe is a math practice game for middle and high school students.

Quiz-Tac-Toe is like a normal Tic-Tac-Toe game, but each time you click a square, you must solve a math problem. If you answer correctly, your X or O is placed in the square. Otherwise the square remains blank.

Winning follows normal Tic-Tac-Toe rules - 3 in a row in any direction.

D2 - Evaluating Solutions

Did the program work?

The program worked very well.

- The teacher can enter new problems and answers easily, using keyboard short-cuts for special math symbols.
- The GUI editor interface makes it easy to review, edit, and delete old problems.
- The students' game interface is simple to use and easy to understand.
- The game follows standard Tic-Tac-Toe rules, so it's easy to play.
- Each game randomly selected a different set of questions.
- Questions are short and quickly answered.
- There were no significant run-time errors.

As shown in documentation section C4, all the criteria for success were addressed successfully.

Various data sets

The program (both editing and playing the game) worked correctly for various topics, with no significant run-time errors. If the topic file is too short (under 9 questions), the game module refuses to start the game, as it needs 9 questions. This possible error was handled correctly.

The design easily allows handles both multiple-choice and full-work answers (including true/false) so the system allows flexibility in the type of question.

Limitations

Mathematical Notation

The most significant limitation is in the presentation of mathematical notation. For example,

fractions appear as "3/4" instead of $\frac{3}{4}$ or $\frac{3}{4}$. Since the questions are generally short and

relatively simple, this is not a huge problem. But more complex algebraic expressions such as

 $\frac{x^2 - 8x + 12}{x - 6}$ cannot be written sensibly, so algebraic fraction problems cannot be set.

No images

The teacher originally asked about including images (diagrams) in the questions. This was not achieved. Questions consist only of text and special symbols.

Text-Only Input

The program only accepts simple text input. This is fine for the game module, but a bit limiting for the Problem Editor module. Teachers can type HTML markup code, but this is too difficult for most teachers. Some teachers might be more comfortable using a word-processor than the simple text-editor.

Additional Features

Future versions of the program should include the possibility of putting images in the problems. Although the current version permits HTML code to be used, and thus an <image> tag, it seems like it would be possible to include images. But this is difficult and the formatting of the question is difficult to control.

An improved version of the program could allow WYSIWYG editing in a larger box, including bold, italic, and images.

It would be nice to allow proper mathematical formula notation. This might be possible through the use of an equation editor, like the tool in MS Word. But this is incompatible with HTML, it's not clear how to link it with a Java program, and the results could not be stored in the RandomAccessFile. So this feature is unlikely to be added in the near future. When we looked at existing online quiz software, this problem also existed in all the programs we saw. The best alternative seemed to be some Flash software, but we did not find anything that had a usable problem editor for the teacher to use.

Appropriateness of the Initial Design

The initial design was quite complete and led easily to the finished program. Large parts of the functional prototype were used as the basis for the finished Game module. The modular design with 3 classes worked very well. The user interviews were very helpful, leading to a clear and complete set of goals that led to a usable program.

Alternative Approaches

The teachers and students at our school have become accustomed to web-based solutions. That allows the students to use the system at home, without installing any software. This Java program cannot be set up to run "on-line" (web-based) because browsers will not open a RandomAccessFile. So even if this program were rewritten as an Applet instead of an Application, it would still not function on a web-site.

It appears that many web-based systems use MySQL and ASP pages to implement data-base functionality in the WWW. Apparently JSP (Java Server Pages) allow a similar functionality. I'm not familiar with any of these technologies, so I don't know whether this sort of change would be appropriate.

Simple Java applications will run from a web-site (without conversion to Applets) as long as there is not database access required. This could be set up by including the questions inside the program, as was done in the prototype, but this greatly limits the flexibility of the system – teachers would not be able to add and change the problems easily. So this approach is probably a dead-end.

Some students won't like the Tic-Tac-Toe game, so it would be sensible to consider other quiz environments. Some possibilities seen in other software are: a race, flying targets, a more conventional test situation, etc. It would be especially useful if the teacher could work on one set of questions and the students could use the same data in a variety of quiz environments, choosing the game they like the best. It should be reasonable straightforward to add other games that use the same database.

Mastery Factors

Mastery Factor	Evidence		
Arrays	Button[] squares, Problem[] problems in Game class		
User-defined objects	Problem class, used in Game class for problems array (lines 22, 115, 175, etc), used in ProblemEditor class for problem variable (lines 22, 137, 151, etc)		
Objects as data records	Problem class (same as above). This saves 3 data items - question, choices and answer, and implements appropriate get. and set. accessor methods.		
Simple ifthen	many places, especially Game actions method (lines 53-107) and ProlemEditor saveProblem method (lines 146-190)		
Complex ifthen	many places, especially Game checkFull method (lines 196-221)		
Loops	many places, especially Game getRandomProblems method (lines 123-154)		
Nested Loops	Game getRandomProblems method (lines 143-154)		
User-defined methods	many		
User-defined methods with parameters	many, especially Problem.replace method(lines 98-108)		
User-defined methods with return values	many, especially ProblemEditor.firstNumber (line 304-324)		
Sorting	not done		
Searching	ProblemEditor.search (line 208)		
File i/o	RandomAccessFiles in Problem class - loadProblem (line 137) and saveProblem (line 113)		
Additional libraries	AWT GUI interfaces in Game and Teacher modules, especially Buttons for tic-tac-toe board in Game, and List box for problem viewer in ProblemEditor		
Sentinels or flags	many methods return boolean flags signaling whether the method was successful or not.
